

BrightTV Viewership Analysis

Project Overview

The BrightTV Viewership Analysis is a data analytics project focused on understanding subscriber behaviour, television viewing patterns, and content consumption trends. The project uses user profile data and viewership transaction records to identify patterns in audience engagement and uncover opportunities to grow the BrightTV subscription base.

The analysis supports the Customer Value Management (CVM) team in making data-driven decisions to improve viewer engagement, increase content consumption, and attract new subscribers.

Business Objective

The primary objective is to provide insights that will help BrightTV grow its subscription base during the financial year by understanding how users interact with the platform and identifying opportunities to improve customer engagement and retention.

Project Objectives

- Analyse user demographics, including age groups, gender, and geographic regions.
- Examine viewership trends over time, including daily, weekly, and monthly viewing patterns.
- Identify the most-watched television channels and popular viewing periods.
- Investigate factors influencing content consumption, such as age group, region, and time of day.
- Compare viewing behaviour across weekdays and weekends.
- Identify low-consumption days and opportunities to increase viewership.
- Recommend relevant content and engagement initiatives to encourage more frequent viewing.
- Develop strategies to attract new subscribers and grow the BrightTV user base.

Data Analytics Process

1. **Data Exploration:** Examine user profile and viewership datasets to understand their structure and identify relevant fields.
2. **Data Cleaning:** Handle missing values, inconsistent categories, duplicate records, and data quality issues.
3. **Data Transformation:** Create age groups, viewing time categories, date fields, and other analytical features using SQL.

4. **Data Analysis:** Investigate audience demographics, channel performance, viewing duration, and consumption trends.
5. **Data Visualisation:** Develop dashboards to communicate key metrics and trends.
6. **Insight Generation:** Identify patterns in viewer behaviour and opportunities to improve engagement.
7. **Recommendations:** Propose content and customer engagement initiatives to support subscription growth.

Tools and Technologies

- **Databricks SQL:** Data cleaning, transformation, and analysis.
- **Databricks:** Data processing and analytical queries.
- **Power BI / Looker Studio:** Dashboard development and data visualisation.
- **Excel:** Data exploration, reporting, and visualisation.
- **GitHub:** Project version control and documentation.

Key Business Questions

- Who are BrightTV's viewers, and what are their demographic characteristics?
- Which channels attract the most viewership?
- When are viewers most active?
- How does viewing behaviour differ across age groups and regions?
- How does consumption vary between weekdays and weekends?
- Which days have the lowest viewing activity?
- What content could encourage viewers to watch more frequently?
- What initiatives could help BrightTV attract new subscribers and increase engagement?

Expected Business Value

The analysis provides a data-driven understanding of BrightTV's audience and viewing behaviour. The findings can help the CVM team identify opportunities for targeted content recommendations, improve viewer engagement, develop audience-specific initiatives, and support subscription growth.

Skills Demonstrated

- SQL data cleaning and transformation
- Data quality assessment
- Exploratory data analysis

- Customer and audience segmentation
- Viewership trend analysis
- KPI development
- Dashboard design and data visualisation
- Business insight generation
- Data-driven recommendation development

This project demonstrates my ability to transform raw data into actionable business insights and communicate analytical findings to support business objectives.
